◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A k-coloring of a graph G is a function c : V → [k] such that if xy ∈ E then c(x) ≠ c(y).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- ▶ A *k*-coloring of a graph *G* is a function $c : V \to [k]$ such that if $xy \in E$ then $c(x) \neq c(y)$.
- ► The chromatic number $\chi(G)$ of G is the least k such that G has a k-coloring.

- A k-coloring of a graph G is a function c : V → [k] such that if xy ∈ E then c(x) ≠ c(y).
- ► The chromatic number $\chi(G)$ of G is the least k such that G has a k-coloring.
- ► A recursive graph (or digraph) is a graph G = (V, E) whose vertex set V and edge set E are both recursive.

- A k-coloring of a graph G is a function c : V → [k] such that if xy ∈ E then c(x) ≠ c(y).
- ► The chromatic number $\chi(G)$ of G is the least k such that G has a k-coloring.
- ► A recursive graph (or digraph) is a graph G = (V, E) whose vertex set V and edge set E are both recursive.
- $\chi_{rec}(G)$ is the least k such that G has a recursive k-coloring.

- A k-coloring of a graph G is a function c : V → [k] such that if xy ∈ E then c(x) ≠ c(y).
- ► The chromatic number $\chi(G)$ of G is the least k such that G has a k-coloring.
- ► A recursive graph (or digraph) is a graph G = (V, E) whose vertex set V and edge set E are both recursive.

- ► A recursive graph (or digraph) is a graph G = (V, E) whose vertex set V and edge set E are both recursive.
- $\chi_{rec}(G)$ is the least k such that G has a recursive k-coloring.

Problem

Given a class C of graphs (closed under isomorphism) does there exist a function f such that every recursive graph $G \in C$ satisfies $f(\chi(G)) \leq \chi_{rec}(G)$ -coloring.

Definition

A graph G is perfect if every induced subgraph H satisfies $\chi(H) = \omega(H)$, where $\omega(G)$ is the number of vertices of the largest complete subgraph of G.

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ 三臣 - のへで

Definition (Bean)

A recursive graph G = (V, E) is highly recursive if each vertex x has degree $d(x) < \infty$ and $d : V \to \mathbf{N}$ is a recursive function.

Definition (Bean)

A recursive graph G = (V, E) is highly recursive if each vertex x has degree $d(x) < \infty$ and $d : V \to \mathbf{N}$ is a recursive function.

Theorem

Let G be a highly recursive graph. Then:

► (Schmerl 1980) $\chi_{rec}(G) \leq 2\chi(G) - 1$. Moreover, this is tight.

Definition (Bean)

A recursive graph G = (V, E) is highly recursive if each vertex x has degree $d(x) < \infty$ and $d : V \to \mathbf{N}$ is a recursive function.

Theorem

Let G be a highly recursive graph. Then:

► (Schmerl 1980) $\chi_{rec}(G) \leq 2\chi(G) - 1$. Moreover, this is tight.

► (Schmerl 1982 — Recursive Brooks' Theorem) If $\omega(G) \le \Delta(G)$ and $\Delta(G) \ge 3$ then $\chi_{rec}(G) \le \Delta(G)$.

For every positive integer k there exists an on-line cocomparability graph G with $\chi(G) = 2$ satisfying FF(G) = k.

Theorem (Bosek, Krawczyk & Szczypka Nov. 2008) Let G be the cocomparability graph of a poset that does not induce $K_{t,t}$. Then

$$FF(G) \leq (4(t-1)(\omega(G)-1)+1)\omega(G).$$

Remark

Interval graphs do not induce $K_{2,2}$.

Theorem First-Fit colors every on-line interval graph G with at most $C\omega(G)$ colors, where

► (*HK 1988*) *C* = 40.

Tolerance Graphs

Definition

A graph G = (V, E) is a tolerance graph if for each vertex v there is an interval I_v and a nonnegative real (tolerance) t_v such that

$$vw \in E$$
 iff $|I_v \cap I_w| \geq \min\{t_v, t_w\}.$

Up-growing Posets

Definition (Felsner 1994)

An on-line poset is up-growing if its presentation order is a linear extension, i.e., no new element is smaller than a previously presented element.
