## On 2-dimensional stochastic sine Gordon equation

with T. Oh, T. Robert (Edinburgh) and Y. Wang (Birmingham)

July 8, 2019

◆ロト ◆母ト ◆臣ト ◆臣ト 三臣 - のへで

### The equation

Hyperbolic sine-Gordon equation on  $\mathbb{T}^2$  with space-time white noise forcing

$$\begin{cases} \partial_{tt}^2 u + (1 - \Delta)u + \gamma \sin(\beta u) = \xi\\ (u, \partial_t u)|_{t=0} = (u_0, u_1) \end{cases}$$

Here:

- $\blacktriangleright (t,x) \in \mathbb{R} \times \mathbb{T}^2 \approx \mathbb{R} \times [0,2\pi)^2.$
- $\blacktriangleright \ \beta, \ \gamma \in \mathbb{R}.$
- $\xi$  is space-time white noise,  $\xi = dW$  where W is a cylindrical Brownian motion.

Formally,  $\xi = dW$ , with W cylindrical Wiener process,

$$W(t) := \sum_{n \in \mathbb{Z}^2} B_n(t) e_n,$$
$$e_n(x) := \frac{1}{2\pi} e^{in \cdot x},$$

 $B_n(t)$  complex Brownian motions, independent except for the condition

$$B_{-n}(t) = \bar{B}_n(t).$$

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

### Sine Gordon as PDE

The deterministic sine-Gordon and sinh-Gordon equations

$$\partial_{tt}^2 u - \partial_{xx}^2 u = \begin{cases} \sin u \\ \sinh u \end{cases}$$

in 1 dimension have an integrable structure. (On  $\mathbb{T}$ : McKean, 1981)

Following Friedlander (1984), McKean (1993) constructs Gibbs type invariant measures for wave equations of the form

$$\partial_{tt}u - \partial_{xx}^2 u = f'(u),$$

including sine-Gordon.

### Stochastic wave equations

- Large literature with colored noise, using stochastic analysis methods. Dalang, Mueller, Walsh, Ondrejat (2010)...
- With white noise. In dimension d = 1, Carmona-Nualart (1988) consider and general smooth nolinearity. They use the explicit Duhamel formula and Walsh's theory of 2 parameter martingales
- ▶ In dimension d = 2 Albeverio et al. construct solutions using Colombeau algebras. Gubinelli-Koch-Oh d = 2, 3 (2017, 2018) and Gubinelli-Koch-Oh-Tolomeo d = 2 use harmonic analysis methods to solve the equation with polynomial nonlinearity.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

Parabolic equation

$$\partial_t u + (1 - \Delta)u + \gamma \sin(\beta u) = \xi.$$

This is an invariant dynamics for continuum SG measure from Roland's talk

$$\frac{1}{Z}\exp\big(-\frac{1}{2}\int_{\mathbb{T}^2}|\nabla u|^2\,\mathrm{d}x+\frac{1}{2}\int_{\mathbb{T}^2}u^2\,\mathrm{d}x+\frac{\gamma}{\beta}\int_{\mathbb{T}^2}:\cos(\beta u(x)):\,\mathrm{d}x\big).$$

Hairer and Shen (2014) obtain local in time solutions to this equation for  $\beta^2 \in (0, \frac{16\pi}{3})$ . Chandra, Hairer, Shen (2016) extend this to  $\beta^2 < 8\pi$ , expected to be the optimal threshold.

#### Thresholds

It is known from work on the static sine-Gordon measure (see introduction to Roland's paper!) that there is an infinite sequence of thresholds

$$\beta_n = \frac{8\pi n}{n+1}$$

where new divergent quantities appear and require renormalization. For Chandra, Hairer and Shen, this translates into the equation requiring further renormalizations to obtain local solutions.

A D > 4 回 > 4 □ > 4

In contrast, we can obtain local in time solutions for any  $\beta > 0$ .

# Singularity

For zero initial data, first Picard iterate solves

$$\partial_{tt}^2 \Psi + (1 - \Delta)\Psi = \xi.$$

Solution

$$\int_0^t \frac{\sin((t-t')\langle \nabla \rangle)}{\langle \nabla \rangle} dW(t')$$
$$= \sum_{n \in \mathbb{Z}^2} \int_0^t \frac{\sin((t-t')\langle n \rangle)}{\langle n \rangle} dB_n(t') \ e_n.$$

Here

$$\mathcal{F}\big(\frac{\sin(t\langle \nabla \rangle}{\langle \nabla \rangle}f\big)(n) = \frac{\sin(t\sqrt{1+|n|^2})}{\sqrt{1+|n|^2}}\widehat{f}(n).$$

Variance of Fourier coefficient labelled by n

$$\mathbb{E}\left[\mathcal{F}(\Psi)(n)^2\right] = \frac{1}{4\pi^2} \int_0^t \left(\frac{\sin((t-t')\langle n\rangle}{\langle n\rangle}\right)^2 dt'$$
$$= \frac{1}{4\pi^2} \left(\frac{t}{2\langle n\rangle^2} - \frac{\sin(2t\langle n\rangle^3}{4\langle n\rangle^3}\right).$$

Sum diverges logarithmically  $\rightarrow \Psi$  is not a  $L^2$  function.

Cannot define the nonlinearity

$$\sin(\beta\Psi) = \Im(e^{i\beta\Psi})$$

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

appearing in the next iterate.

### Wick renormalization

For a Gaussian random variable  $X \sim N(0, \sigma^2)$ , define

$$: X^k : \stackrel{\text{def}}{=} H_k(X; \sigma),$$

where  $H_k$  is the *k*th Hermite polynomial:

$$e^{\lambda x - \frac{\sigma^2}{2}\lambda} = \sum_{k=0}^{\infty} \frac{\lambda^k}{k!} H_k(x;\sigma).$$

Define

$$:e^{iX}:\stackrel{\text{def}}{=}\sum_{k=0}^{\infty}\frac{(i\beta)^k}{k!}:X^k:=e^{\frac{\beta^2}{2}}e^{i\beta X}$$

### Renormalizing $\Psi$

Consider Fourier truncation of  $\Psi_N$ 

$$\Psi_N = \sum_{n \in \mathbb{Z}^2} \chi_N(n) \int_0^t \frac{\sin((t-t')\langle \nabla \rangle)}{\langle \nabla \rangle} \, \mathrm{d}B_n(t') \, e_n,$$

 $\chi_N(\cdot) = \chi(\cdot/N)$  smooth cutoff.

Variance

$$\sigma_N(t) = \mathbb{E}[\Psi_N(t,x)^2] \sim t \log N.$$

We show that

$$: e^{i\beta\Psi_N} := e^{\frac{\beta^2}{2}\sigma_N^2(t)} e^{i\beta\Psi_N}.$$

\*ロ \* \* @ \* \* ミ \* ミ \* ・ ミ \* の < や

converges in some function space and define  $e^{i\beta\Psi}$  as its limit.

#### Da Prato-Debussche trick

Look for solutions of form

$$u_N = \Psi_N + v_N.$$

Residual term  $v_N$  satisfies the equation

$$\begin{cases} \partial_{tt}^{2} v_{N} + (1 - \Delta) v_{N} + \Im(: e^{i\beta\Psi_{N}} : e^{i\beta v_{N}}) = 0\\ (v_{N}, \partial_{t} v_{N})|_{t=0} = (u_{0}, u_{1}). \end{cases}$$

With renormalization, the terms :  $e^{i\beta\Psi_N}$  : have a limit. We try to solve for  $v_n$ , in particular, we need to make sense of the product :  $e^{i\beta\Psi_N}$  :  $e^{i\beta v_N}$ .

This type of ansatz has appeared in McKean (1995), Bourgain (1996), Da Prato-Debussche (2002), Hairer (2014), etc.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

We show the solutions to

$$\begin{cases} \partial_{tt}^2 u_N + (1 - \Delta)u_N + \gamma_N \sin(\beta u_N) &= \underbrace{P_N \xi}_{\text{Fourier truncation}} \\ (u_N, \partial_t u_N)|_{t=0} = (u_0, u_1) \end{cases}$$

with

$$\gamma_N(t,\beta) = e^{\frac{\beta^2}{2}\sigma_N(t)} \to \infty$$

(ロト (個) (E) (E) (E) (E) (O) (O)

converge in probability in a suitable space of distributions.

#### Results: Local existence

#### Theorem (Oh, Robert, S., Wang, 2019)

Let  $\beta \neq 0$ , and s > 0. For any  $(u_0, u_1) \in H^s \times H^{s-1}$ , there exists  $T_0(||u_0||_{H^s}, ||u_1||_{H^{s-1}})$  such that for any  $T \leq T_0$ ,  $\exists \Omega_N(T)$  such that

1. for  $\omega \in \Omega_N(T)$ , there exists a unique  $u_N$  to the truncated SSG in form

$$\Psi_N + v_N \subset C([0,T], H^{-\epsilon}(\mathbb{T}^2)).$$

 $v_N$  has positive regularity.

2.

 $\mathbb{P}(\Omega_N(T)^c) \to 0$ 

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

uniformly in N as  $T \rightarrow 0$ .

There exists a stopping time  $\tau$  and a stochastic process u in  $C([0,T]; H^{-\epsilon}(\mathbb{T}^2))$ , of the form

$$u = \Psi + v,$$

where v has positive regularity, such that, for each T > 0,  $u_N$  converges in probability to u in  $C([0,T]; H^{-\epsilon}(\mathbb{T}^2))$  on  $\{\tau \ge T\}$ .

#### Results: Triviality

#### Theorem (Oh, Robert, S., Wang, 2019)

Let  $\beta \in \mathbb{R} \setminus \{0\}$  and fix  $(u_0, u_1) \in H^s \times H^{s-1}$  for some s > 0. Given any small T > 0, the solutions to the non-renormalized SSG equation

$$\begin{cases} \partial_{tt}^2 u_N + (1 - \Delta)u_N + \sin(\beta u_N) &= P_N \xi\\ (u_N, \partial_t u_N)|_{t=0} &= (u_0, u_1) \end{cases}$$

converge in probability to the solution of the linear stochastic wave equation

$$\begin{cases} \partial_{tt}^2 u + (1 - \Delta)u &= \xi\\ (u, \partial_t u)|_{t=0} &= (u_0, u_1) \end{cases},$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

in  $C([0,T],H^{-\epsilon}(\mathbb{T}^2)),\ \epsilon>0$  as  $N\to\infty.$ 

## GKO

Gubinelli, Koch, Oh (2017) study solutions of the nonlinear wave equation in 2d:

$$\partial_{tt} u_N + (1 - \Delta) u_N \pm : u_N^k := P_N \xi,$$

with  $k \ge 2$  an integer.

They show convergence in probability of the  $u_N$  in  $C([0,T], H^{-\epsilon})$ .

Renormalization is simpler, because the nonlinearity is of power type.

Hairer-Shen (2014) and Chandra-Hairer-Shen consider the equations

$$\partial_t u_N + (1 - \partial_x^2) : u_N : +\gamma : \sin(\beta u_N) := P_N \xi$$

+ロト 4 団 ト 4 豆 ト 4 豆 - りへで

and show that for  $\beta^2<8\pi,$  the solutions converge in some negative Hölder space to a limiting stochastic process.

#### Regularity of nonlinearity

Equation for  $v_N = \Psi_N - u_N$ 

$$\partial_{tt}^2 v_N + (1 - \Delta) v_N + \Im(: e^{i\beta\Psi_N} : e^{i\beta v_N}).$$

Rewrite as

$$v_N(t) = \partial_t S(t) u_0 + S(t) u_1 - \int_0^t S(t - t') \Im(:e^{i\beta\Psi_N} : e^{i\beta\nu_N}) dt',$$
$$S(t) = \frac{\sin(t\langle \nabla \rangle)}{\langle \nabla \rangle}.$$

\*ロ \* \* @ \* \* ミ \* ミ \* ・ ミ \* の < や

We would like to control  $v_N$  a priori in Sobolev space  $H^s$ , s > 0.

To proceed, need to investigate regularity of :  $e^{ieta\Psi_N}$  :.

### Regularity of nonlinearity

Let  $\alpha > 0$ . Expand the exponential and use the identities

$$\mathbb{E}[\Psi_N(t,x_1)\Psi_N(t,x_2)] = \sum_{|n| \le N} e_n(x_1 - x_2) \int_0^t \frac{\sin((t-s)\langle n \rangle)^2}{\langle n \rangle^2} \,\mathrm{d}s,$$

 ${\sf find}$ 

$$\mathbb{E}[\|\langle \nabla \rangle^{-\alpha} : e^{i\beta\Psi_N} : \|_{L^2(\mathbb{T})}^2] \\ \leq \sum_{k \ge 0} \sum_{|n_1|, \dots, |n_k| \le N} \iint \langle n_1 + \dots + n_k \rangle^{-2\gamma} \langle n_1 \rangle^{-2} \cdots \langle n_k \rangle^{-2} \\ \lesssim C(\beta^2, \alpha) < \infty,$$

independently of N.

We will need higher moments of  $\langle \nabla \rangle^{-\gamma}: e^{i\beta \Psi_N}:$  to close a fixed point argument.

For power type nonlinearity, we can control higher powers of the second moment, since

$$\mathbb{E}[|P_k(\phi)|^p] \lesssim p^{kp/2} \mathbb{E}[|P_k(\phi)|^2]^{p/2},$$

if  $\phi$  is Gaussian and  $P_k$  has degree k.

 $W^{\gamma,p}(\mathbb{T}^2)$  is defined by the norm

$$\|f\|_{W^{\gamma,p}(\mathbb{T})} = \|\langle \nabla \rangle^{\gamma} f\|_{L^p(\mathbb{T}^2)}.$$

#### Theorem

Let  $\beta \neq 0$  and  $\beta^2 T < 8\pi$ . Given any  $1 \leq p, q < \infty$  and  $\alpha > \frac{\beta^2 T}{8\pi}$ , the sequence of random variables :  $e^{i\beta\Psi_N}$  : is Cauchy in  $L^p(\Omega; L^q([0,T]; W^{-\alpha,\infty}(\mathbb{T}^2)))$ .

 $W^{-lpha,p}$  norm of :  $e^{ieta\psi_N}$  :

Goal: compute 
$$\|: e^{i\beta\Psi_N}: \|_{L^{2p}_{\omega}L^q_T W^{-\alpha,\infty}_x}$$
.

Define 
$$J_{lpha}$$
 by  $\langle 
abla 
angle^{\delta-lpha}f=J_{lpha-\delta}*f, \quad J_{lpha}(x)\sim |x|^{lpha-d}.$ 

#### Need to estimate

$$\mathbb{E}\left[|\langle \nabla \rangle^{\delta-d} : e^{i\beta\Psi_N}(t,x) : |^{2p}\right] \\= e^{p\beta^2\sigma_N(t)} \int_{(\mathbb{T}^2)^p} \mathbb{E}\left[e^{i\beta\sum_{j=1}^p (\Psi_N(t,y_{2j}) - \Psi_N(t,y_{2j-1}))}\right] \prod_{k=1}^{2p} J_{\alpha-\delta}(x-y_k) \,\mathrm{d}y.$$

### Gaussian computation

Expectation is a characteristic function

$$\begin{split} & \mathbb{E}\Big[e^{i\beta\sum_{j=1}^{p}(\Psi_{N}(t,y_{2j})-\Psi_{N}(t,y_{2j-1}))}\Big] \\ &= e^{-\frac{\beta^{2}}{2}\mathbb{E}[|\sum_{j=1}^{p}(\Psi_{N}(t,y_{2j})-\Psi_{N}(t,y_{2j-1})|^{2}]} \\ &= e^{-\frac{\beta^{2}}{2}\sum_{j,k=1}^{2}\epsilon_{j}\epsilon_{k}\Gamma_{N}(t,y_{j}-y_{k})}. \end{split}$$

Here,  $\Gamma_N$  is the covariance kernel

$$\Gamma_N(t, x - y) := \mathbb{E}[\Psi_N(t, x)\Psi_N(t, y)] \approx -\frac{t}{4\pi} \log(|x - y| + N^{-1}).$$

- Euclidean  $\Phi_d^3$  with  $d = 2 + \frac{\beta^2}{2\pi}$ .
- Euclidean  $\Phi_d^4$  with  $d = 2 + \frac{\beta^2}{4\pi}$ .
- KPZ with  $d = \frac{\beta^2}{4\pi}$ .

### An inequality

To bound the integrals

$$\int_{(\mathbb{T}^2)^p} \Big(\prod_{j,k=1}^{2p} |y_k - y_k|^{-\epsilon_i \epsilon_j} \frac{\beta^2 t}{4\pi} \Big) \prod_{k=1}^{2p} |x - y_k|^{\alpha - d} \mathrm{d}y$$

use

#### Lemma

Let  $\lambda > 0$  and  $p \in \mathbb{N}$ . Given  $j \in \{1, \dots, 2p\}$ , set

$$\epsilon_j = (-1)^j.$$

Let  $S_p$  be permutations of  $\{1, \ldots, p\}$ .

For any 
$$\{y_j\}_{j=1,...,2p}$$
 of  $2p$  points in  $\mathbb{T}^2$  and any  $N \in \mathbb{N}$ ,  
$$\prod_{1 \le j < k \le 2p} (|y_j - y_k| + N^{-1})^{\epsilon_j \epsilon_k \lambda} \lesssim \max_{\tau \in S_p} \prod_{1 \le j \le p} (|y_{2j} - y_{2\tau(j)+1}| + N^{-1})^{-\lambda}.$$

▲□▶ ▲□▶ ▲臣▶ ▲臣▶ 三臣 - のへで

## An inequality

$$\prod_{1 \le j < k \le 2p} (|y_j - y_k| + N^{-1})^{\epsilon_j \epsilon_k \lambda} \lesssim \max_{\tau \in S_p} \prod_{1 \le j \le p} (|y_{2j} - y_{2\tau(j)+1}| + N^{-1})^{-\lambda}.$$

- A similar but more general result appears in Hairer-Shen ("dipole computation").
- Froehlich '76 obtains a related estimate by exact identity due to Cauchy

$$\frac{\prod_{1 \le i < j \le 2n} |z_i - z_j|^{\alpha} |w_i - w_j|^{\alpha}}{\prod_{i,j=1}^{2n} |z_i - w_i|^{\alpha}} = \left| \det(1/(z_i - w_j))_{1 \le i,j \le 2n} \right|.$$

#### Closing the argument

Residual equation for  $v_N = u_N - \Psi_N$ 

$$v_N(t) = \partial_t S(t) u_0 + S(t) u_1 - \int_0^t S(t - t') \Im(:e^{i\beta\Psi_N} : e^{i\beta v_N}) =: \Gamma(u).$$

$$\text{Input: } \|:e^{i\beta\Psi_N}:\|_{L^{2p}_{\omega}L^q_TW^{-\alpha,\infty}_x} \leq C \text{ for } \alpha > \tfrac{\beta^2T}{8\pi} \text{ uniformly in } N.$$

 $S(t) = \frac{\sin(t\langle \nabla \rangle)}{\langle \nabla \rangle}$  gains one derivative. Fix T and assume  $(u_0, u_1) \in H^s \times H^{1-s}$  for  $s = 1 - \gamma$  close to 1:

$$\|v_N\|_{H^s} \le \|(u_0, u_1)\|_{H^s \times H^{1-s}} + \left\|\Im(:e^{i\beta\Psi_N}: e^{i\beta\nu_N})\right\|_{L^1_T H^{s-1}_x}.$$

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

### Closing the argument

$$\begin{split} \|\Im(:e^{i\beta\Psi_{N}}:e^{i\beta v_{N}})\|_{L_{T}^{1}H_{x}^{s-1}} &\lesssim T^{1/2} \|e^{i\beta v}\|_{L_{T}^{\infty}H_{x}^{1-s}}\|:e^{i\beta\Psi_{N}}:\|_{L_{T}^{2}W_{x}^{-(1-s),2/(1-s)}}.\\ \text{By "fractional chain rule" (see e.g. Christ and Weinstein, 1991)} \\ &\|e^{i\beta v_{N}}\|_{H^{1-s}}^{2} \lesssim 1 + \beta^{2} \|\langle\nabla\rangle^{1-s}v\|_{L^{2}}^{2}. \end{split}$$
(1)

We use a fixed point argument for small T on the probability set

$$\Omega_{T,N} = \{ \| : e^{i\beta\Psi_N} : \|_{L^2 W_x^{s-1,\frac{2}{1-s}}} \le 1 \}.$$

This works if 1-s is small, so that we have the required regularity  $-\alpha$  for  $:e^{i\beta\Psi_N}:$ 

#### Closing the argument: differences

In estimating the nonlinearity using the fractional chain rule, we did not have to face the nonlinearity yet. Right side of (1) was of the form "constant + linear in  $v_N$ ".

For the difference of solutions, we have

$$\begin{split} \|\Gamma(v) - \Gamma(w)\|_{L^{\infty}_{T}H^{s}_{x}} &\leq \|\Im((e^{i\beta v} - e^{i\beta w})e^{i\beta \Psi_{N}}\|_{L^{1}_{T}H^{s-1}} \\ &\lesssim T^{1/2}\|F(v) - F(w)\|_{H^{1-s}}, \end{split}$$

where

$$F(u) = e^{i\beta u}.$$

Now write

$$F(v) - F(w) = (v - w) \int_0^1 F'(\tau u + (1 - \tau)w) \,\mathrm{d}\tau.$$

To control the product, we use the fractional product rule. Let  $s \in [0, 1]$ . For  $r, p_j, q_j \in (1, \infty)$  with  $\frac{1}{p_j} + \frac{1}{q_j} = \frac{1}{r}$ , j = 1, 2 then  $\|fg\|_{W^{s,r}} \lesssim \|f\|_{L^{p_1}} \|g\|_{W^{s,q_1}} + \|f\|_{W^{s,q_2}} \|g\|_{L^{q_2}}.$ 

\*ロ \* \* @ \* \* ミ \* ミ \* ・ ミ \* の < や

Applying this with  $p_1 = \frac{2}{1-s}$ ,  $q_1 = \frac{2}{s}$ ,  $p_2 = \frac{1}{1-s}$ :

$$\begin{split} \|F(v) - F(w)\|_{H^{1-s}} \\ \lesssim \|v - w\|_{L^{p_1}} \left\| \int_0^1 F'(\tau v + (1-\tau)w) d\tau \right\|_{W^{1-s,q_1}} \\ + \|v - w\|_{W^{1-s,p_2}} \left\| \int_0^1 F'(\tau v + (1-\tau)w) d\tau \right\|_{L^{q_2}}. \end{split}$$

We conclude using the Sobolev embeddding.

$$\lesssim \|v - w\|_{H^s} \left\| \int_0^1 F'(\tau v + (1 - \tau)w) d\tau \right\|_{H^s} + \|v - w\|_{H^s} \left\| \int_0^1 F'(\tau v + (1 - \tau)w) d\tau \right\|_{L^{\frac{2}{s}}}$$

In the argument above, we made an assumption on the regularity s (depending on T,  $\beta$ ) of the initial data  $(u_0, u_1)$  to close the argument. To access lower regularities, we use mixed space-time *Strichartz spaces*.

### Invariant measure

The hyperbolic stochastic sine-Gordon measure

$$\frac{1}{Z}\exp\big(-\frac{1}{2}\int_{\mathbb{T}^2}|\nabla u|^2\,\mathrm{d} x+\frac{1}{2}\int_{\mathbb{T}^2}u^2\,\mathrm{d} x+\frac{\gamma}{\beta}\int_{\mathbb{T}^2}:\cos(\beta u(x)):\,\mathrm{d} x\big)$$

is formally invariant

In upcoming work, we use this invariance to construct global solutions to the equation when  $\beta^2 < 8\pi$ . This type of argument was used by Bourgain (1993).

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

To construct the measure, we use a recent variational method of Barashkov-Gubinelli (2018).

Thanks for your attention, and Happy Birthday, H.T. Yau!
