

Mechanistic modelling of cell migration in the immune system

"Transparent modelling" beyond ML

Killer T cell
Cancer cell

T cells as anomaly detectors.

T cells:

- Detect and clean up infected/cancerous cells

Adapted from National Cancer Institute (NIH)

T cells as anomaly detectors.

T cells:

- Detect and clean up infected/cancerous cells
- Using their T-cell receptor (TCR) to screen for short peptides displayed on a molecule called MHC

T cells as anomaly detectors.

T cells:

- Detect and clean up infected/cancerous cells
- Using their T-cell receptor (TCR) to screen for short peptides displayed on a molecule called MHC
- Compromised (infected/cancerous) cells display different peptides than healthy cells do
→ "anomaly detection"

T cells as **highly specialized** anomaly detectors.

T cells:

- Detect and clean up infected/cancerous cells
- Using their T-cell receptor (TCR) to screen for short peptides displayed on a molecule called MHC
- Compromised (infected/cancerous) cells display different peptides than healthy cells do
→ "anomaly detection"
- Specific because each T cell's receptor recognises specific peptides

T cells search for anomalies in lymph nodes.

Only **one in a million** T cells can detect any given new pathogenic signal (peptide).

T cells search for anomalies in lymph nodes.

Only **one in a million** T cells can detect any given new pathogenic signal (peptide).

T cells must **search** for these rare targets that can activate them.

T cells search for anomalies in lymph nodes.

Only **one in a million** T cells can detect any given new pathogenic signal (peptide).

T cells must **search** for these rare targets that can activate them.

They do this in central "meeting hubs" called **lymph nodes**.

T cells search for anomalies in lymph nodes.

1.00

▶ 0:00 / 0:12

🔊 🗄️ ⋮

A video player interface with a black background. At the top left, the number '1.00' is displayed. Below it is a play button icon followed by the text '0:00 / 0:12'. To the right of the play button are three icons: a speaker icon, a full-screen icon, and a vertical ellipsis icon. A white progress bar is located at the bottom of the player area.

The question: why no traffic jams?

?

How do T cells respond to complex and crowded environments, and does their smooth traffic flow ever break down?

Approach:
mechanistic
modelling.

"What I cannot create, I do not understand."

— Richard Feynman

"Creating" real and simulated T-cell crowds.

Put T cells in controlled environments, inspired by the physics field of **crowd dynamics**.

1. In silico: computational model
2. In vitro: controlled environment in the lab

Can we "build a crowd" — i.e., can our model predict what real T cells will do *in vitro*?

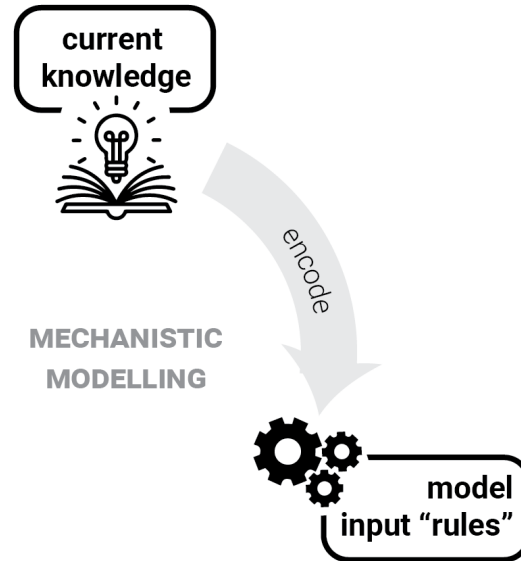

Data: time-lapse imaging of moving cells.

Predictions: what will the crowd do?

Knowledge (or models of it)

Predictions

Black-box models: no knowledge gain (since we don't know *how* they work)

Interpretability is critical to extract knowledge from mechanistic models.

Example:
T-cells in one lane traffic.

Step 1: **gather** input knowledge.

top view

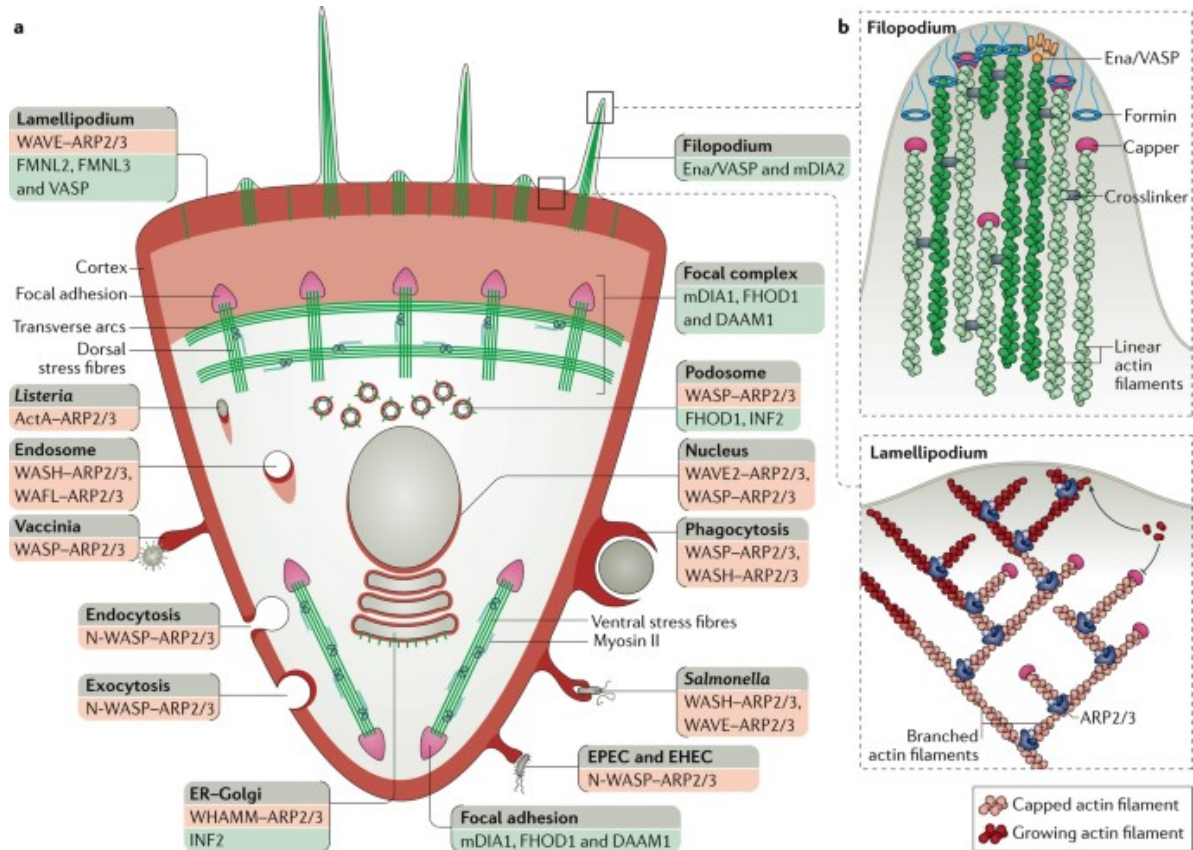

side view

Adapted from: Dupré et al (2015). doi: [10.3389/fimmu.2015.00586](https://doi.org/10.3389/fimmu.2015.00586).

Step 1: gather input knowledge.

Carlier and Shekhar (2017). doi: [10.1038/nrm.2016.172](https://doi.org/10.1038/nrm.2016.172).

Step 2: **encode** into a model.

Evan Ingersoll & Gaël McGill, [Images from science 3 exhibition](#).

Option 1: Detailed model

Explicitly encode every molecule and resulting force.

+ highly interpretable!

+ **emergent** behavior.

– too expensive to model crowds.

Step 2: **encode** into a model.

Option 2: Phenomenological – Cellular Potts Model (CPM)¹

Pixels belong to cells, which move by copying pixels:

$$P_{\text{copy}} = \begin{cases} e^{-\Delta H/T} & \Delta H > 0 \\ 1 & \Delta H \leq 0 \end{cases}$$

¹Graner and Glazier (1992). doi:[10.1103/PhysRevLett.69.2013](https://doi.org/10.1103/PhysRevLett.69.2013)

Step 2: **encode** into a model.

Option 2: Phenomenological – Cellular Potts Model (CPM)¹

Pixels belong to cells, which move by copying pixels:

Copy **success** chance (P_{copy}) is higher when it helps the cell:

$$P_{\text{copy}} = \begin{cases} e^{-\Delta H/T} & \Delta H > 0 \\ 1 & \Delta H \leq 0 \end{cases}$$

Powered by [Artistoo.net](https://www.Artistoo.net)

¹Graner and Glazier (1992). doi:[10.1103/PhysRevLett.69.2013](https://doi.org/10.1103/PhysRevLett.69.2013)

Step 2: **encode** into a model.

Option 2: Phenomenological – Cellular Potts Model (CPM)¹

Pixels belong to cells, which move by copying pixels:

Copy **success** chance (P_{copy}) is higher when it helps the cell:

Powered by [Artistoo.net](https://www.Artistoo.net)

→ Cells have shapes and interact naturally through **volume exclusion** (each pixel can only belong to one cell at a time). Crowd behavior still **emerges**.

¹Graner and Glazier (1992). doi:[10.1103/PhysRevLett.69.2013](https://doi.org/10.1103/PhysRevLett.69.2013)

Step 2: **encode** into a model.

Cells move if we add **positive feedback** on protrusive **activity** (\approx actin polymerization)¹:

Parameters:

λ_{act} \approx protrusive force

\max_{act} \approx polymerized actin lifetime

→ realistic cell shape and motility^{1,2}.

¹Niculescu et al. (2015). doi:[10.1371/journal.pcbi.1004280](https://doi.org/10.1371/journal.pcbi.1004280)

²Wortel et al. (2021). doi:[10.1016/j.bpj.2021.04.036](https://doi.org/10.1016/j.bpj.2021.04.036)

Step 3: **predict** crowd behavior.

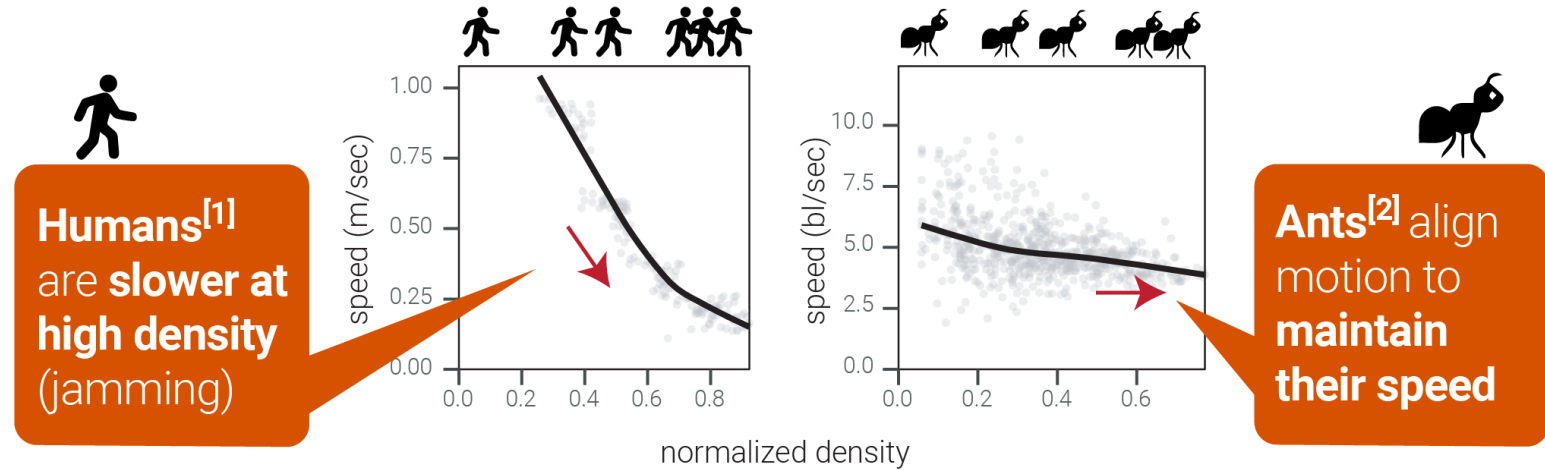

A cornerstone scenario in **crowding physics**: one-lane traffic.

¹John et al. (2009). doi:[10.1103/PhysRevLett.102.108001](https://doi.org/10.1103/PhysRevLett.102.108001)

²Seyfried et al. (2005). doi:[10.1088/1742-5468/2005/10/p10002](https://doi.org/10.1088/1742-5468/2005/10/p10002)

Step 3: **predict** crowd behavior.

A cornerstone scenario in **crowding physics**: one-lane traffic.

¹John et al. (2009). doi:[10.1103/PhysRevLett.102.108001](https://doi.org/10.1103/PhysRevLett.102.108001)

²Seyfried et al. (2005). doi:[10.1088/1742-5468/2005/10/p10002](https://doi.org/10.1088/1742-5468/2005/10/p10002)

Step 3: **predict** crowd behavior.

What do T cells do? Put single (CPM) cells **together** in **constrained channels** and predict crowd behavior:

Step 3: **predict** crowd behavior.

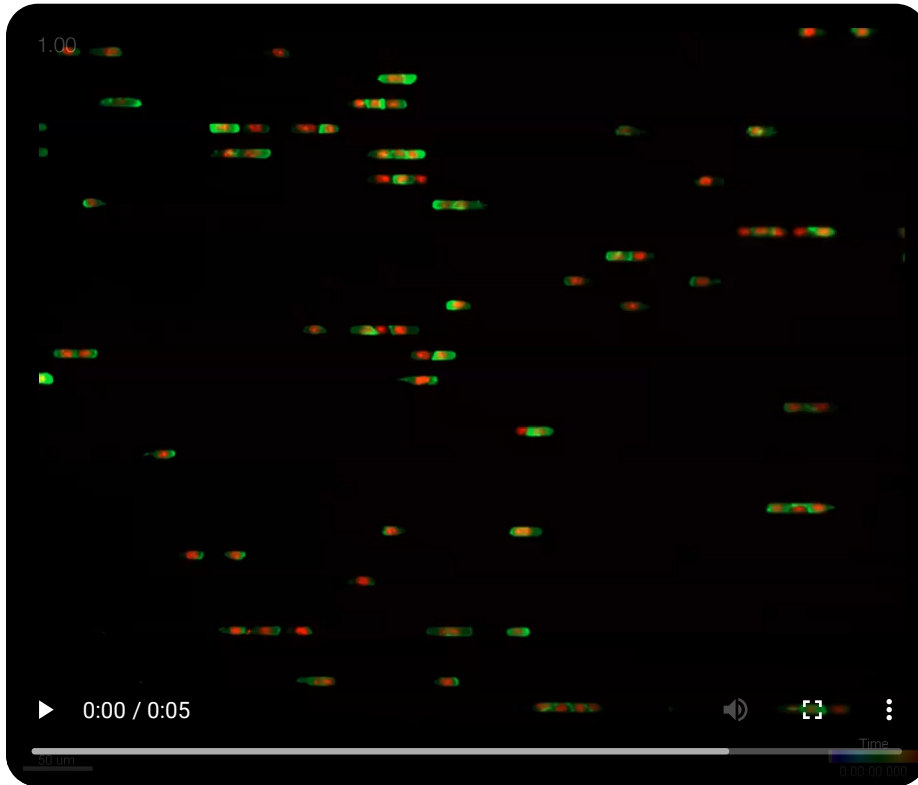

What do T cells do? Put single (CPM) cells **together** in **constrained channels** and predict crowd behavior:

Qualitatively: cells rapidly align into "trains" to keep moving.

Step 4: **test** model predictions.

What about real T cells?

Data: Jérémy Postat and Judith Mandl.

Step 4: **test** model predictions.

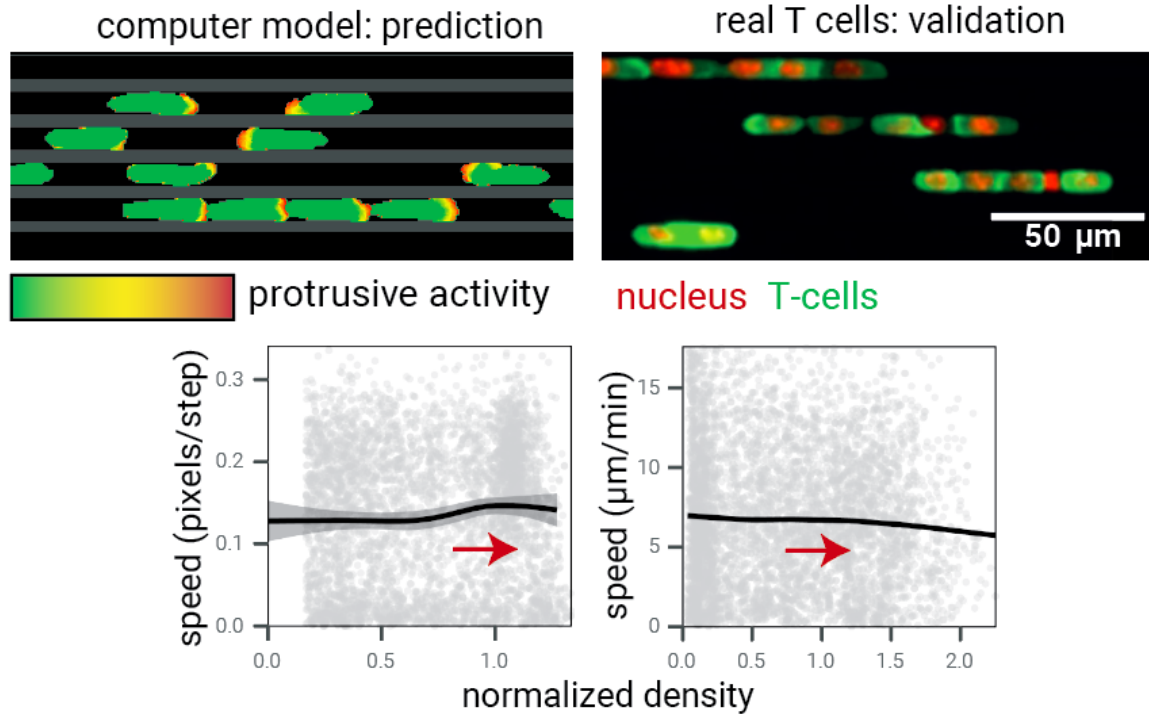

What about real T cells? **Again: train formation!**

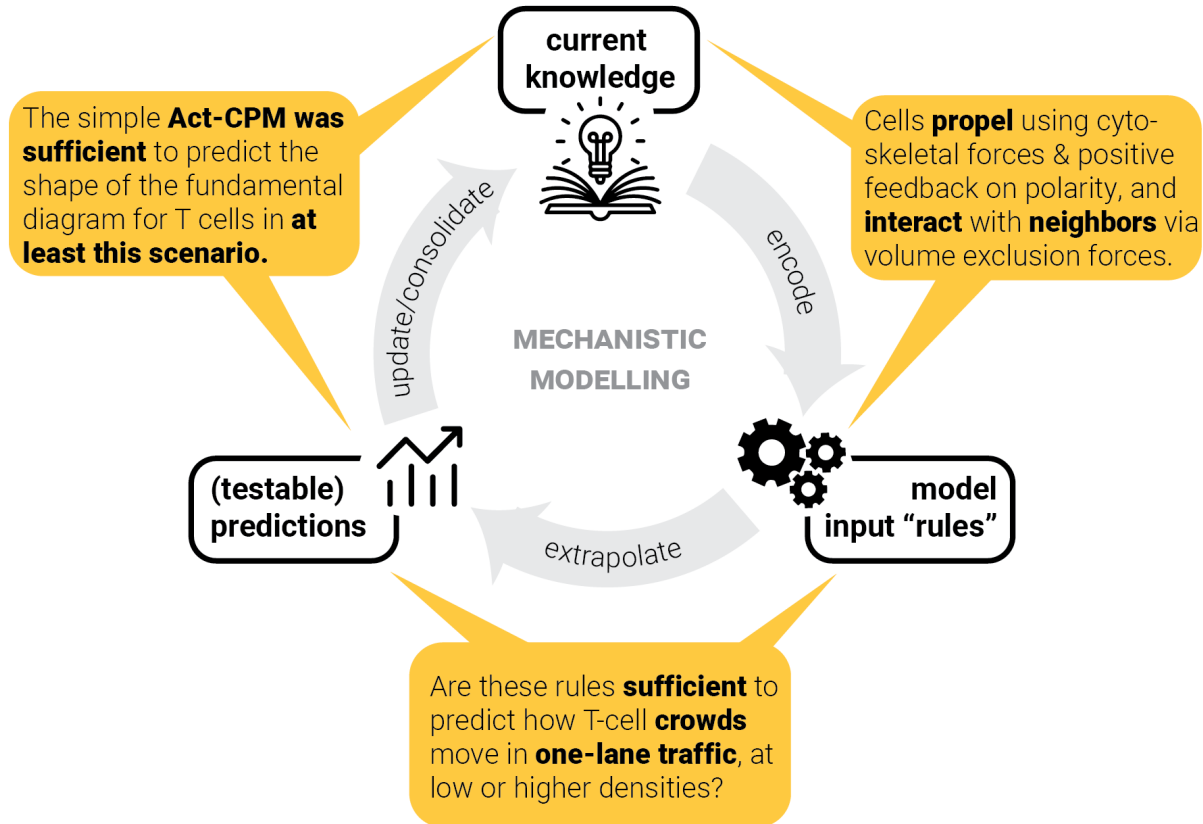

Data: Jérémy Postat and Judith Mandl.

Step 4: **test** model predictions.

Quantitatively: the fundamental diagram in both cases is flat.

Step 5: **consolidate** model – and repeat.

Step 5: **consolidate** model – and repeat.

Model consolidation \neq proof.

Can we predict crowd behavior in other scenarios as well?

Step 5: **consolidate** model – and repeat.

Pedestrian crowds can form **jamming arches** near an exit. This scenario is well-studied because of **crowd disasters**, such as at the Love Parade (Berlin, 2010).

→ What about T cells?

Step 5: **consolidate** model – and repeat.

Simulated T cells can indeed form jamming arches:

Work in progress, but see: Wortel (2021). <https://repository.ubn.ru.nl/handle/2066/236680>.

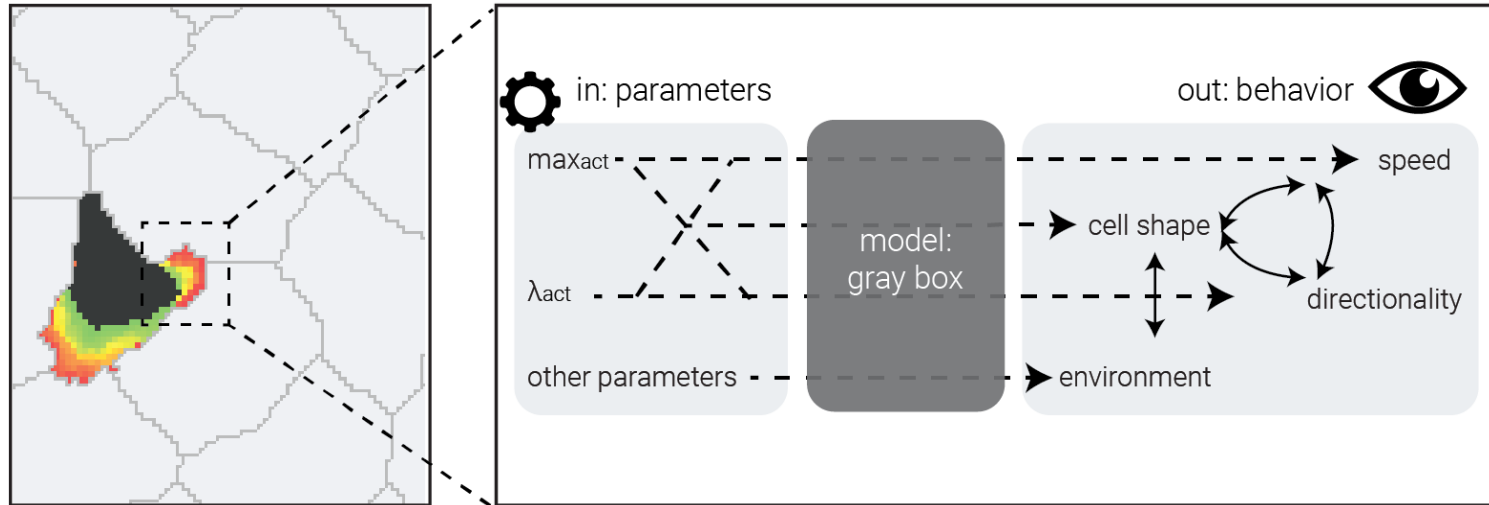

Work of Shabaz Sultan

Challenge:
Are CPMs interpretable?

CPMs are not fully interpretable.

Emergent behavior is nice, but...

CPMs are not fully interpretable.

Emergent behavior is nice, but...

... we still don't know **exactly** how parameters lead to outputs.

"Explaining" CPMs – visualization

Visualizing and manipulating models interactively: artistoo.net

TOOLS AND RESOURCES

Artistoo, a library to build, share, and explore simulations of cells and tissues in the web browser

Inge MN Wortel^{1,2†*}, Johannes Textor^{1,2†*}

¹Department of Tumor Immunology, Radboud Institute for Molecular Life Sciences, Nijmegen, Netherlands; ²Institute for Computing and Information Sciences, Data Science, Radboud University, Nijmegen, Netherlands

Abstract The cellular Potts model (CPM) is a powerful *in silico* method for simulating biological processes at tissue scale. Their inherently graphical nature makes CPMs very accessible in theory, but in practice, they are mostly implemented in specialised frameworks users need to master before they can run simulations. We here present Artistoo (Artificial Tissue Toolbox), a JavaScript library for building 'explorable' CPM simulations where viewers can change parameters interactively, exploring their effects in real time. Simulations run directly in the web browser and do not require third-party software, plugins, or back-end servers. The JavaScript implementation imposes no major performance loss compared to frameworks written in C++; Artistoo remains sufficiently fast for interactive, real-time simulations. Artistoo provides an opportunity to unlock CPM models for a broader audience: interactive simulations can be shared via a URL in a zero-install setting. We discuss applications in CPM research, science dissemination, open science, and education.
